	📋 Field	⚙ Value	+
1	Energy Cap	50	
2	Regen Amount	5 energy	
3	Regen Time	every 60 minutes	
4	Spin Cost	base cost × selected multiplier	
+			

Important

The cap only limits free/passive regen. Rewards, purchases, events, and other sources can still push energy above the cap.

What the Saved Data Means

- currentCount = how much energy the player has right now
- lastRegenAt = when the last processed regen tick happened
- nextRegenAt = when the next regen tick is scheduled
- lastSavedAt = when the game last saved the energy state

Simple Rules

- Free regen works only up to the cap.
- Rewards, purchases, and events can push energy above the cap.
- If the player is below the cap, regen can build up while away.
- If the player is at or above the cap, no new regen ticks build up.
- If a timer was already running before the player went over the cap, that one timer keeps running in the background.
- If the player is still at or above the cap when that timer ends, the tick is lost.
- If the player drops below the cap before that timer ends, show the remaining time and give the energy when the timer ends.
- Always use server time.

Example

1. Player is at 49 energy. Timer starts: 60:00.
2. 10 minutes later, player gets a reward and goes to 65 energy.
3. The timer keeps running in the background.
4. If the player spends back below 50 before the timer ends, show the remaining time.
5. If the player is still at/above 50 when the timer ends, that tick is discarded.

How the Timer Works — Simple English

Plain-language timer behavior for design, product, QA, and development.

A. When the Player Opens the Game

1. Load saved energy data
2. If energy is below the cap, calculate missed regen while away
3. If energy is at or above the cap, do not build new ticks
4. If an old timer was already scheduled, let only that one resolve
5. Show updated timer state

B. When the Player Is Below the Cap

1. Timer counts down
2. Missed time while away can add multiple ticks
3. Add energy up to the cap only
4. If the cap is reached, stop the timer
5. If still below the cap, schedule the next tick

Below-Cap Example

0 energy, away for 3 hours = 15 energy gained. This is 3 ticks of 5 energy.

C. When the Player Goes Over the Cap

1. Do not start building new ticks
2. If a timer was already running, keep that one timer in the background
3. Hide the timer or show “Full”
4. When that timer ends, check the player’s current energy

When the Hidden Timer Ends

If player is below the cap: give the tick.
If player is still at/over the cap: discard the tick.

Spend Energy

If player drops below the cap and no timer exists, start a new 60-minute timer.
If a timer already exists, keep it and show the remaining time.

Gain Energy from Rewards

1. Increase current energy
2. If player is now at/over the cap, do not build new ticks
3. Keep an already-running timer only until its next scheduled tick

Quick Summary

Below cap = regen can accumulate.

At or above cap = no new regen accumulation.

One already-running timer may continue in the background.

Over-cap at tick time = tick is lost.
